Optional program/script executes that offers options for automatic repair preferences. For example:

- quick format
- low level format
- run software automatic repair
- use hardware diagnostics & and automatic switching
- run Norton Utilities
- run Disk First Aid
- run EKG
- run suggested default for quick repair
- run suggested default for better repair
- run suggested default for best repair
- setup from backup
- setup from Master Template
- switch hardware as needed
- Integrate bookmarks, E-mail, and other personal data from:
 - most recent prior to repair
 - backup at time of repair
 - older backup/archive
 - at time of repair give user option
 - automatically select based on default

Figure F200.2

Switching process deactivates Normal Use

Switching process activates Internet Accessible Data
Storage Device

On programmed scheduled basis (such as hourly or
daily) a program downloads anti-virus update data to the
Internet accessible data storage device. This anti-virus
data is automatically and/or manually transferred to the
Quarantine data storage device by a software program.

Anti-virus software scans quarantine drive on
programmed scheduled basis.

Sheet 7 of 10

Figure F200.3

E-mail is downloaded and/or Internet browsing occurs using programs located on the "Internet Accessible" Data Storage Device. Simultaneously, all downloaded data may be checked by the most current virus update.

Optionally, user can view and/or work on files on Internet Accessible Data Storage device. If this option is chosen:

Switching process activates quarantine data storage device

Data is moved to Quarantine data storage device on a programmed schedule and/or by user.

Optionally, instead of the user viewing and/or working on files on the Internet Accessible Data Storage Device, a "Temporary Work Area" data storage device or partition may be used for viewing and/or working on data that has been downloaded, or will be uploaded.

all downloaded/created files are moved by user and/or by software to the quarantine device on demand and/or on an schedule.

Data can be moved to the "Quarantine" data storage device and/or other data storage device by several methods. Examples

Comparison of data to a master template...
changed files will be moved to quarantine data storage device

Sheet 9 of 10

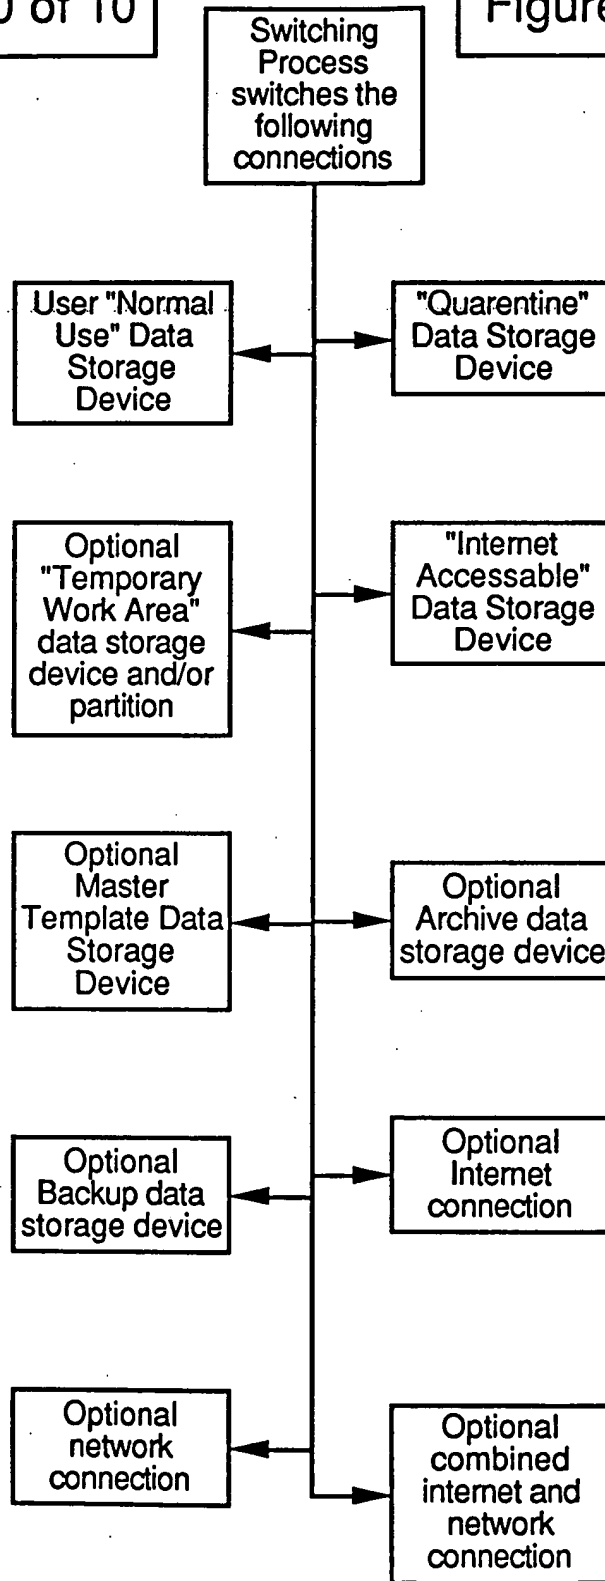

Figure F200.5

```

For this reason a program may hold downloaded data in the quarantine data storage device until such time as updates are available.];
```

Program can identify downloads and newly created documents and move them and/or save to quarantine and/or "Temporary work area" data storage device/partition.

Program can identify file types and/or date and creation time, and move based on those factors

Data is stored in the Quarantine Data Storage Device for a scheduled amount of time that may be varied. For example, Anti-Virus detection companies may issue issue anti-virus updates several days after a new virus has been released. For this reason a program may hold downloaded data in the quarantine data storage device until such time as updates are available.

The diagram illustrates the internal architecture of the W5215.4 Master Data Storage Device. Key components and their interconnections are as follows:

- Power Supply (W15216):** Provides 12 Volt and 5 Volt power to the system.
- Reset Jumper:** A jumper used to reset the device.
- Switch or Switch Lock (W15211):** Controls the device's operation.
- Circuit Board / PLC (W15210):** The central processing unit, featuring a 5.375" width and 1.25" height.
- Controller:** Manages data flow and device operations.
- ID Jumper(s):** Used to set the device's ID.
- Optional Reset PRAM, CMOS, CUDA, etc. See Diagram R61:** Provides additional reset functionality.
- Master Data Storage Device (User A ID 0 W5215.4):** The primary storage unit.
- User A Data Storage Device ID switches from ID 0 to ID 1 W5215.5:** Allows for switching between different storage devices.
- Backup for User A ID 2. Device is mounted by software when needed. W5215.6:** A backup storage unit.
- Indicator W5212.6:** Provides visual feedback on device status.
- Cable Connection to Data Port:** Connects the device to external storage protocols (ATA, IDE, SCSI, Firewire, USB2, etc.).
